In 2015, Systems India was ranked 21st of great places to work in India.In June 2014, it was ranked 6th of great places to work in India.In October 2008, Systems Canada Inc. was named one of "Canada's Top 100 Employers" by Mediacorp Canada Inc., and was featured in Maclean's newsmagazine.

Criticisms:

Pricing
has been criticized for its pricing practices, with retail prices being up to twice as much in non-US countries. As pointed out by many, it is significantly cheaper to pay for a return airfare ticket to the United States and purchase one particular collection of 's software there than to buy it locally in Australia.

After revealed the pricing for the Creative Suite 3 Master Collection, which was £1,000 higher for European customers,[46] a petition to protest over "unfair pricing" was published and signed by 10,000 users. In June 2009, further increased its prices in the UK by 10% in spite of weakening of the pound against the dollar, and UK users are not allowed to buy from the US store. ranked no. 5 on a list of Internet's 9 Most Hated Companies, based on a 2013 survey on Reddit.com.'s Reader and Flash were listed on The 10 most hated programs of all time on TechRadar.com.

Security
Hackers have exploited vulnerabilities in programs, such as Reader, to gain unauthorized access to computers. 's Flash Player has also been criticized for, among other things, suffering from performance, memory usage and security problems (see criticism of Flash Player). A report by security researchers from Kaspersky Lab criticized for producing the products having top 10 security vulnerabilities.

Observers noted that was spying on its customers by including spyware in the Creative Suite 3 software and quietly sending user data to a firm named Omniture. When users became aware, explained what the suspicious software did and admitted that they: "could and should do a better job taking security concerns into account". When a security flaw was later discovered in CS5, sparked outrage by saying it would leave the flaw unpatched, so anyone who wanted to use the software securely would have to pay for an upgrade. Following a fierce backlash decided to provide the software patch.

has been criticized for pushing unwanted software including third-party browser toolbars and free virus scanners, usually as part of the Flash update process,[58] and for pushing a third-party scareware program designed to scare users into paying for unneeded system repairs.

Customer data breach
On October 3, 2013, the company initially revealed that 2.9 million customers' sensitive and personal data was stolen in security breach which included encrypted credit card information. later admitted that 38 million active users have been affected and the attackers obtained access to their IDs and encrypted passwords, as well as to many inactive accounts.The company did not make it clear if all the personal information was encrypted, such as email addresses and physical addresses, though data privacy laws in 44 states require this information to be encrypted.

A 3.8 GB file stolen from and containing 152 million usernames, reversibly encrypted passwords and unencrypted password hints was posted on AnonNews.org. LastPass, a password security firm, said that failed to use best practices for securing the passwords and has not salted them.Another security firm, Sophos, showed that used a weak encryption method permitting the recovery of a lot of information with very little effort.According to anIT expert Simon Bain, has failed its customers and 'should hang their heads in shame'.

Many of the credit cards were tied to the software-by-subscription service.[72] offered its affected US customers a free membership in a credit monitoring service, but no similar arrangements have been made for non-US customers.When a data breach occurs in the US, penalties depend on the state where the victim resides, not where the company is based.

After stealing the customers' data, cyber-thieves also accessed 's source code repository, likely in mid-August 2013. Because hackers acquired copies of the source code of proprietary products,they could find and exploit any potential weaknesses in its security, computer experts warned. Security researcher Alex Holden, chief information security officer of Hold Security, characterized this breach, which affected , ColdFusion and numerous other applications, as "one of the worst in US history". [79] also announced that hackers stole parts of the source code of , which according to commentators could allow programmers to copy its engineering techniques[80] and would make it easier to pirate 's expensive products.

Published on a server of a Russian-speaking hacker group, the "disclosure of encryption algorithms, other security schemes, and software vulnerabilities can be used to bypass protections for individual and corporate data" and may have opened the gateway to new generation zero-day attacks. Hackers already used ColdFusion exploits to make off with usernames and encrypted passwords of PR Newswire's customers, which has been tied to the security breach.They also used a ColdFusion exploit to breach Washington state court and expose up to 160,000 Social Security numbers.

Anti-competitive practices
acquired Aldus Corp. in 1994, a software vendor that sold FreeHand, a competing product.Freehand was direct competition to , 's flagship vector-graphics editor. The Federal Trade Commissionintervened and forced to sell FreeHand back to Altsys, and also banned from buying back FreeHand or any similar program for the next 10 years (1994-2004). Altsys was then bought by Macromedia, which released versions 5 to 11.When acquired Macromedia in December 2005, it stalled development of Freehand in 2007, effectively rendering it obsolete.With FreeHand and , controlled the only two products that compete in the professional illustration program market for Macintosh operating systems.

In 2011, a group of 5,000 Freehand graphic designers convened under the banner Free Freehand, and filed a civil antitrust complaint in the US District Court for the Northern District of California against .The suit alleged that has violated federal and state antitrust laws by abusing its dominant position in the professional vector graphic illustration software market and that has engaged in a series of exclusionary and anti-competitive acts and strategies designed to kill FreeHand, the dominant competitor to 's software product, instead of competing on the basis of product merit according to the principals of free market capitalism. had no response to the claims and the lawsuit was eventually settled.The FreeHand community believes should release the product to an open-source community if it cannot update it internally.

As of 2010, on its FreeHand product page stated "While we recognize FreeHand has a loyal customer base, we encourage users to migrate to the new CS4 software which supports both PowerPC and Intel-based Macs and Microsoft Windows XP and Windows Vista." As of 2016, the Freehand page no longer exists and simply redirects to the page. 's software FTP server still contains a directory for FreeHand, but it is empty.
